

Receptionist Module – Backend Requirements

1. Overview

Receptionist manages appointments, walk-in bookings, patient check-in, token flow, and queue management.

2. User Role Table (users)

- id
- name
- email
- mobile
- role (RECEPTIONIST)
- clinic_id
- status

3. Appointment Management

Receptionist can:

- Create walk-in appointments
- Select clinic, treatment type, date, and slot

4. Appointment Table Additions

- check_in_time
- called_time
- completed_time
- is_current
- created_by (USER / RECEPTIONIST)

5. Appointment Status Flow

BOOKED → CHECKED_IN → IN_PROGRESS → COMPLETED

↓

NO_SHOW

↓

CANCELLED

6. Queue Management

- View appointments by date and slot
- See token number, patient name, status, estimated time
- Call next patient

- Skip patient
- Recall patient

7. Token Reassignment Feature

Fields:

- original_token_number
- current_token_number
- is_shifted
- shifted_from_token
- shift_reason

8. Token Shift Logic

- If patient absent → mark SKIPPED
- Assign token to another patient
- Old patient loses token
- New patient gets same token position

9. Rules

- Shift only if patient not checked-in or marked NO_SHOW
- Cannot shift if IN_PROGRESS or COMPLETED

10. Walk-in Patient

- Add basic details (name, mobile)
- Assign token automatically

11. Real-Time System

- Update doctor dashboard, patient app, receptionist panel
- Use WebSockets / Firebase

12. APIs

- POST /receptionist/book-appointment
- GET /receptionist/appointments
- POST /receptionist/check-in
- POST /receptionist/call-next
- POST /receptionist/skip
- POST /receptionist/assign-token
- POST /receptionist/recall

13. Example

Token 3 patient absent → skipped

Token 3 assigned to new patient

Old patient marked skipped

Summary

Receptionist controls booking, queue, tokens, and real-time flow.
